1. INTRODUCTION

1.1. Background

During the past fifteen years the Ecosystems Processes Component (EPC) of the Chesapeake Bay Water Quality Monitoring Program has learned a great deal about the importance of exchanges of oxygen and nutrients across the sediment-water interface and the dynamics of these interactions. Sediment oxygen consumption can be an important sink for oxygen in estuarine environments and sediment nutrient releases can be a large internal source of both nitrogen and phosphorous to the water column (Boynton *et al.*, 1991). Both of the latter compounds are essential for phytoplankton growth, which can become excessive when nutrient supplies are large. Thus, sediment processes can play an important role in determining water quality conditions by lowering oxygen levels and promoting excessive algal growth.

Estuarine water quality and habitat conditions are directly affected by fluxes of nutrients from the sediments, especially in summer during hypoxic and anoxic events. The magnitudes of these fluxes appear to be directly influenced by nutrient and organic matter loading to the Bay. Both annual and interannual patterns demonstrate that when these external nutrient and organic matter loadings decrease, the cycle of organic matter deposition to the sediments, sediment oxygen demand, and the release of nutrients into the water column also decrease and water quality and habitat conditions improve (Boynton *et al.*, 1995). Evaluation of these nutrient loadings (via exchanges between sediment and the water column) as well as the loadings of other pollutants provides the information necessary to diagnose the apparent health of an estuary.

The Clean Water Act Section 303(d)(1)C and federal regulation 40CFR 130.7C(1) directed each State to develop a Total Maximum Daily Load (TMDL) for all impaired waters on the Section 303 (d) list, taking into account seasonal variations and a margin of safety (MOS) to allow for uncertainty. A TMDL reflects the total pollutant loading of the impairing substance a body of water can receive and still meet water quality standards. The 1996 303(d) list submitted to EPA by the Maryland Department of the Environment lists several Chesapeake Bay small, western shore rivers as being impaired by nutrients, sediments, fecal coliform bacteria and low dissolved oxygen.

The Maryland Department of the Environment (MDE) is in the process of developing numerous TMDL assessments for the Maryland Western Shore. This process involves extensive monitoring, as well as the development of watershed and estuarine models. Results from these models will be used to calculate the allocation of loads between point and non-point sources of the TMDLs.

1.2. Description of Project

Measurements of net sediment-water exchanges of nutrients (phosphorus and nitrogen) and oxygen, characterization of the nutrient content of surface sediments, water column

respiration and measurement of water quality conditions in near-bottom water were made monthly during June, July and August of 2005 at twenty four stations in Maryland's Upper and Lower Western Shore tributaries. These measurements were made in conjunction with other efforts in the development of TMDLs for these estuaries.

2. ACQUISITION AND ANALYSIS OF TMDL SEDIMENT-WATER OXYGEN AND NUTRIENT EXCHANGES DATA

2.1. Location of TMDL Stations

Twenty four stations were located in Maryland's Western Shore tributaries (Figure 2-1, Table 2-1). At all twenty four of these stations, measurements of sediment-water oxygen and nutrient exchanges were made along with associated bottom water conditions, surficial sediment chlorophyll-*a*, particulate carbon, nitrogen and phosphorus concentrations and estimates of surface water column respiration.

2.2. Sampling Frequency

The sampling frequency was based on the seasonal patterns of sediment water exchanges observed in previous studies conducted in the Chesapeake Bay region (Kemp and Boynton, 1980, 1981; Boynton *et al.*, 1982; Boynton and Kemp, 1985). Based on these results the monitoring design adopted for this TMDL study involved three monthly measurements: June, July and August 2005.

2.3. Field Methods for TMDL Study

2.3.1. Water Column Profiles

At each TMDL station, vertical water column profiles of temperature, salinity and dissolved oxygen were measured at 0.5 m intervals from the surface to the bottom using a Yellow Springs Instrument (YSI) 600R or 6920 DataSonde®. Turbidity of surface waters was measured using a Secchi disk.

2.3.2. Water Column Nutrients

Near-bottom water samples (0.5 – 1.0 m above the sediment surface) were collected using a high volume submersible pump system. Samples were filtered, where appropriate, using 0.7 µm GF/F filter pads, and immediately frozen. Samples were analyzed by Nutrient Analytical Services Laboratory (NASL) for the following dissolved nutrients: ammonium (NH_4^+), nitrite (NO_2^-), nitrite plus nitrate ($\text{NO}_2^- + \text{NO}_3^-$) and dissolved inorganic phosphorus corrected for salinity (DIP or PO_4^{3-}).

2.3.3. Sediment Profiles

At each TMDL station an intact sediment core (~ 7 cm diameter) was used to measure the oxidation reduction (redox) potential (Eh) of the sediment porewater. The redox potential of the overlying water was also measured (+1cm measurement). Sediment redox (mV)

was measured at the sediment surface and at 1 and 2 cm below the sediment surface. Additionally, surficial sediments were sampled for total and active sediment chlorophyll-a to a depth of 1 cm. Particulate carbon (PC), particulate nitrogen (PN) and particulate phosphorus (PP) were sampled to a depth of 1 cm.

2.3.4. Sediment Flux Measurements

The protocols used in TMDL flux estimates included a single sediment core with no blank. An intact sediment core constituted a benthic microcosm where changes in oxygen, nutrient and other compound concentrations were determined over a fixed incubation time.

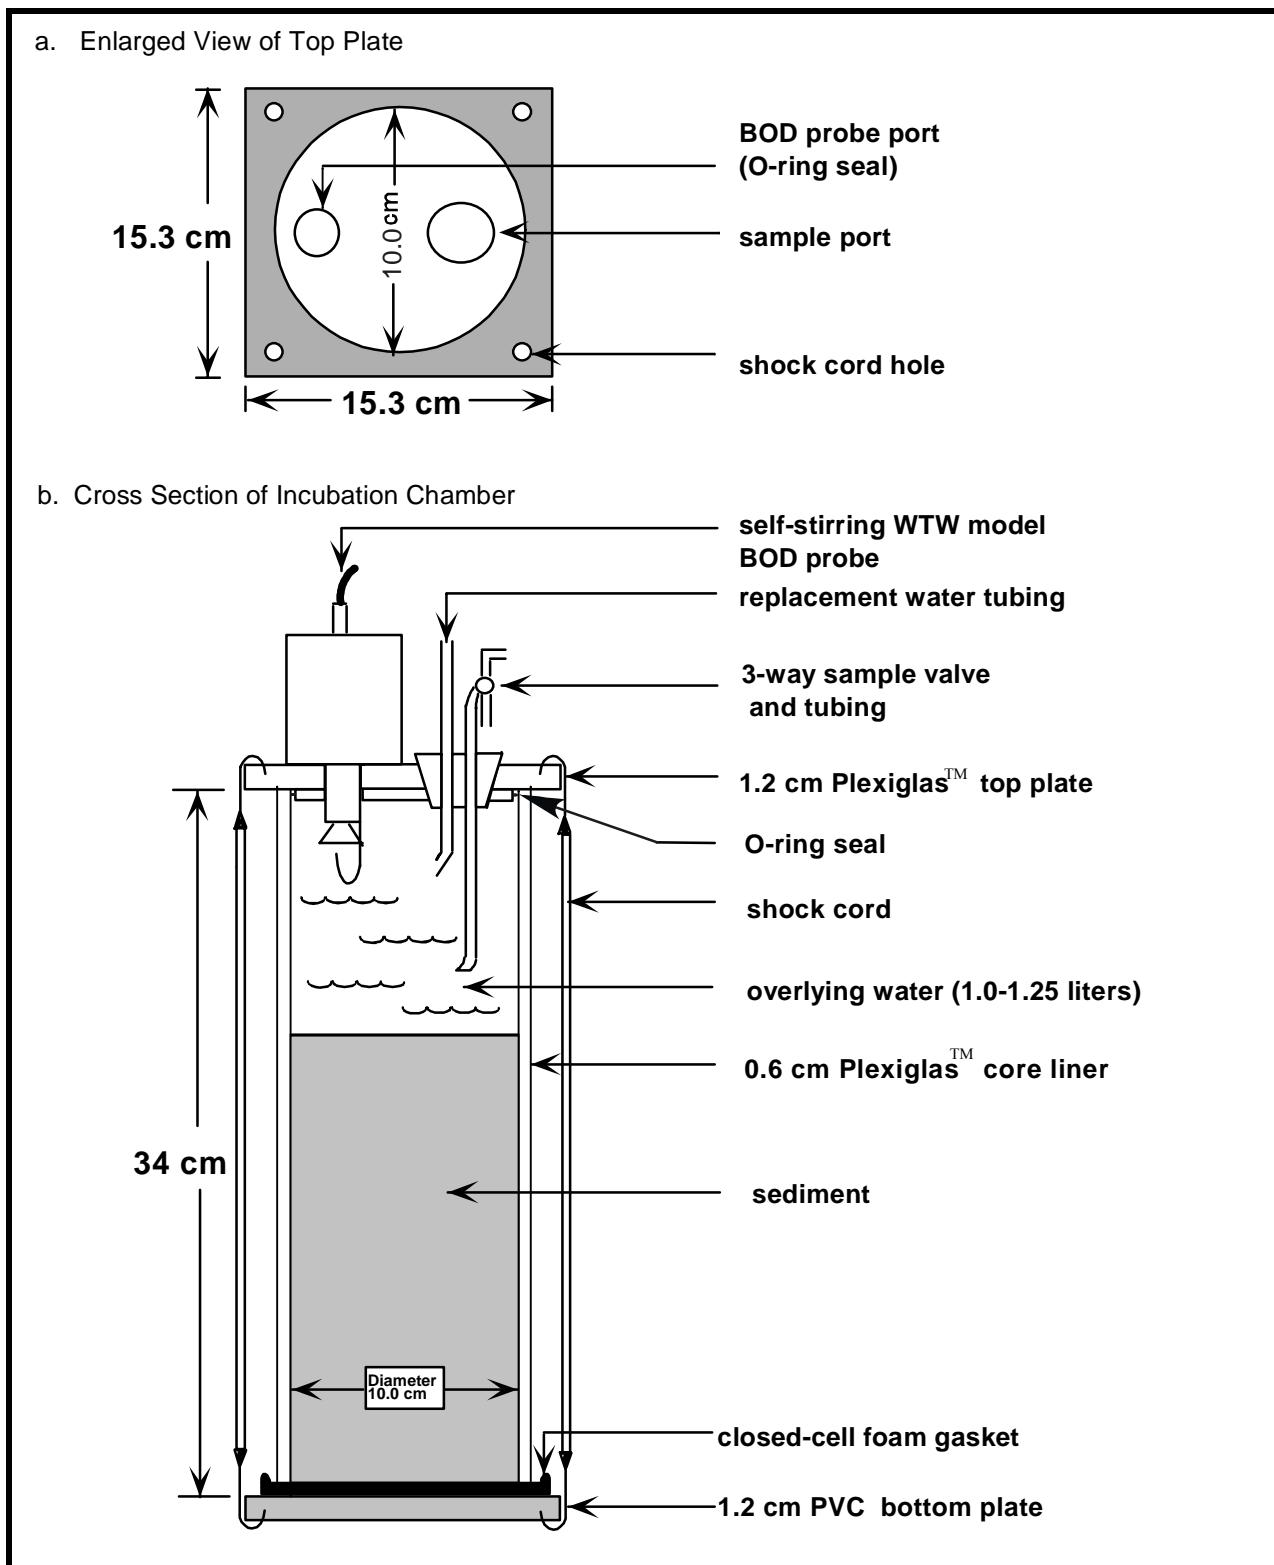

A single intact sediment core was collected at each station using a modified Bouma box corer. These cores were then transferred to a Plexiglass cylinder (15 cm diameter x 30 cm length) and inspected for disturbances from large macrofauna or cracks in the sediment surface. If the sample was satisfactory, the core was fitted with an O-ring sealed top containing various sampling ports, and a gasket sealed bottom (Figure 2-2). The core was then placed in a darkened, temperature controlled holding tank where overlying water in

the core was slowly replaced by fresh bottom water ensuring that water quality conditions in the core closely approximated *in situ* conditions.

During the period in which the flux measurements were taken, the cores were placed in a darkened temperature controlled bath to maintain ambient temperature conditions. The overlying water in a core was gently circulated with no induction of sediment resuspension via stirring devices attached to oxygen probes. Oxygen concentrations were recorded and overlying water samples (35 ml) were extracted from each core every 60 minutes during the incubation period. Cores were incubated for 3 hours with a total of 4 measurements taken. As a water sample was extracted from a core, an equal amount of ambient bottom water was added to replace the lost volume. Water samples were filtered and immediately frozen for later analysis for ammonium (NH_4^+), nitrite (NO_2^-), nitrite plus nitrate ($\text{NO}_2^- + \text{NO}_3^-$) and dissolved inorganic phosphorous (DIP or PO_4^{3-}). Oxygen and nutrient fluxes were estimated by calculating the rate of change in concentration over the incubation period and converting the volumetric rate to a flux using the volume to area ratio of each core.

Figure 2-2. Schematic Diagram of the Incubation Chamber

- a. Enlarged View of Top Plate
- b. Cross Section of Incubation Chamber

2.3.5. Water Column Respiration

Water column respiration measurements were made using a modified biological oxygen demand (BOD) protocol. Whole water samples were taken from the mixed layer at approximately 1 m below the surface using a high volume submersible pump system. Glass BOD bottles (300 ml) were gently filled with sample water and allowed to overfill, exchanging the volume at least two times. Duplicate samples were taken for initial and final measurements. Initial samples were fixed immediately with reagents for determination of dissolved oxygen (APHA, 1989). Final samples (in dark BOD bottles) were capped, incubated in a dark ambient flowing seawater incubator and fixed with reagents at the termination of the incubation period (24 hours). Fixed samples were stored at room temperature and returned to the lab for final titration analysis.

2.4. Chemical Analyses used in TMDL Study

Methods for the determination of dissolved and particulate nutrients were: ammonium (NH_4^+), nitrite (NO_2^-), nitrite plus nitrate ($\text{NO}_2^- + \text{NO}_3^-$), and dissolved inorganic phosphorus (DIP or PO_4^{3-}) were measured using the automated method of EPA (1979); particulate carbon (PC) and particulate nitrogen (PN) samples were analyzed using an Elemental Analyzer; particulate phosphorus (PP) concentration were obtained by acid digestion of muffled-dry samples (Aspila *et al.*, 1976); methods of Strickland and Parsons (1972) and Parsons *et al.* (1984) were followed for chlorophyll-*a* analysis.

2.5. Methods and Data Quality Indicators

Table 2-2. A summary of laboratory methods and performance criteria (from Rohland *et al.*, 2001; NASL, 2004).

Matrix	Parameter (Units)	Analytical Method	MDL***	Precision (% CV)*	Accuracy (percent spike recovery)
Water	Ammonium (NH_4^+ ; μM)	Berthelot Reaction	0.0030 μM	< 5%	90-110%
Sediment	Active Chlorophyll- <i>a</i> ($\mu\text{g l}^{-1}$)	Flourescence after acidification (EPA 445.0)	0.79 $\mu\text{g l}^{-1}$	-	-
Sediment	Total Chlorophyll- <i>a</i> ($\mu\text{g l}^{-1}$)	Fluorescence before acidification (EPA 445.0)	0.65 $\mu\text{g l}^{-1}$	-	-
Water	Dissolved Inorganic Phosphorus (DIP; μM)	Antimony-phospho-molybdate complex	0.0007 μM	< 5%	90-110%
Water	Nitrite (NO_2^- ; μM)	Diazo compound	0.0003 μM	< 5%	90-110%
Water	Nitrite + Nitrate ($\text{NO}_2^- + \text{NO}_3^-$; μM)	Copper-cadmium reduction	0.0007 μM	< 5%	90-110%
Sediment	Sediment Particulate Carbon (%[wt])	Combustion in O_2	0.13%	< 5%**	-
Sediment	Sediment Particulate Nitrogen (%[wt])	Combustion in O_2	0.0084%	< 5%**	-
Sediment	Sediment Particulate Phosphorus (%[wt])	Antimony-phospho-molybdate complex	0.0087%	< 5%**	-

* Concentration dependent

3. DATA MANAGEMENT PROCEDURES

3.1. QA/QC Field Checks

Cruises and experiments were scheduled well ahead of time with Research Fleet Operations (RFO). A schedule of activities for each day of field work (cruise and experimental plan) was submitted to the PI and other members of the staff. Cruises and experiments that were canceled due to weather or mechanical problems were rescheduled.

3.1.1. Preparation of Collection Gear

Two to three weeks prior to initiating a research cruise and experimental run all the necessary equipment involved in the collection of water and sediment samples, incubation of sediment cores and collection of physical water quality data were inventoried using specially prepared checklists. All equipment was cleaned, checked and calibrated to insure that it was fully operational. The equipment was packed into containers for easy transport and loaded aboard vehicles and the research vessel (R/V Aries). The checklist was re-examined to verify the presence of all necessary gear.

Standards and reagents involved in the calibration of instrumentation and for chemical analyses in the field were made according to a schedule of shelf life (i.e. daily, weekly or seasonally). All chemicals were handled, prepared and stored in accordance with standard laboratory practices. Material Safety Data Sheets (MSDS) for all chemicals and reagents used were available at all times.

3.1.2. Potential Contamination

During the course of a research cruise and experiments different steps were taken to insure that the chances for contamination were minimized. These practices involved almost constant washing of equipment over the course of a cruise. All containers used to collect bulk raw water were rinsed with copious amounts of sample (station) water before they were filled and were thoroughly cleaned with fresh water and dried at the end of the cruise. Containers from which samples were taken for chemical analysis were rinsed additionally with deionized water. The apparatus for taking the sediment samples as well as the incubation equipment was thoroughly washed with station water before it was used to collect samples. Upon completion of the cruise the apparatus was rinsed with fresh water. Single use/disposable plastic vials and centrifuge tubes that require no cleaning were used to collect water and sediment samples (after being fully processed) for chemical analysis. All syringes and other laboratory equipment used in processing these samples were washed with deionized water between each use. All glassware associated with the preparation of standards and reagents was cleaned with copious amounts deionized water and acid washed (10% HCL) when appropriate.

3.1.3. Calibration Procedures and Frequency

All instruments involved in the collection of physical water quality data (temperature, conductivity, salinity and dissolved oxygen) were calibrated daily. Dissolved oxygen calibration incorporates a standard air calibration based on air temperature and barometric pressure. Conductivity/salinity was calibrated with a 0.10 molar standard of potassium chloride. Temperature is calibrated by the manufacturer only when the instrument is returned for service. All instruments were maintained in accordance with manufacturer's specifications. If any apparent problems arose the instrument was removed from use until the malfunction was diagnosed and remedied.

3.1.4. Recording of Field Data

All field data were recorded on specially prepared field data sheets and the initials of the person recording the data were recorded on each data sheet. The raw data sheets were reviewed for possible missing data values due to sample collection problems. These sheets were filed in the laboratory. A cruise log book was also kept.

3.2. General Information Related to Data Sets

3.2.1. Naming Conventions

Data files were given unique names that were a combination of an alpha code reflecting the name of the data set, the type of data set and a numeric descriptor which indicated the number of the cruise.

3.2.2. Incorporation of Error Codes in Data Tables

In order to keep a record of problems experienced while collecting data a one or two letter code (Table 3-1) was entered in the data table, which describes the problems associated with questionable parameter values. Valid entries from the Sediment Data Management Plan (EPA, 1989) were used and where necessary.

Table 3-1. Analysis Problem Codes*(This table is also added at the beginning of the Appendices for reference).*

ANALYSIS PROBLEM CODE	DESCRIPTION
A	Laboratory accident
B	Interference
C	Mechanical/materials failure
D	Insufficient sample
N	Sample Lost
P	Lost results
R	Sample contaminated
S	Sample container broken during analysis
V	Sample results rejected due to QA/QC criteria
W	Duplicate results for all parameters
X	Sample not preserved properly
AA	Sample thawed when received
BB	Torn filter paper
EE	Foil pouch very wet when received from field, therefore poor replication between pads, mean reported
FF	Poor replication between pads; mean reported
HD	Particulate and chlorophyll-a samples only taken at -1.0 cm of the Eh profile
HH	Sample not taken
JJ	Amount filtered not recorded (Calculation could not be done)
LL	Mislabeled
NI	Data for this variable are considered to be non-interpretable
NN	Particulates found in filtered sample
NR	No replicate analyzed for epiphyte strip chlorophyll-a concentration
PP	Assumed sample volume (pouch volume differs from data sheet volume; pouch volume used)
QQ	Although value exceeds a theoretically equivalent or greater value (e.g., PO4F>TDP), the excess is within precision of analytical techniques and therefore not statistically significant.
SD	All sampling at station discontinued for one or more sampling periods
SS	Sample contaminated in field
TF	Dissolved oxygen probe failure
TL	Instrument failure in research laboratory
TS	Dissolved oxygen probe not stabilized
TT	Instrument failure on board research vessel
UU	Analysis discontinued
WW	Station was not sampled due to bad weather conditions, research vessel mechanical failure, or failure of state highway bridges to open or close
XX	Sampling for this variable was not included in the monitoring program at this time or was not monitored during a specific cruise
YB	No blank measured for MINI-SONE fluxes
YY	Data not recorded

3.3. Western Shore TMDL Data Sets

The data collected at each TMDL station were organized into five data sets, where xx = cruise number:

WATER COLUMN PROFILES (Filename: **TMDLWSPFxx**, Appendix A) reports temperature, salinity and dissolved oxygen data measured at half meter intervals in the water column.

WATER COLUMN NUTRIENTS (Filename: **TMDLWSNTxx**, Appendix B) reports bottom water dissolved nutrient concentrations.

SEDIMENT PROFILES (Filename: **TMDLWSSPx**, Appendix C) includes redox potential and sediment measurements of total and active chlorophyll-a, particulate carbon, particulate nitrogen and particulate phosphorus concentrations.

CORE DATA (Filename: **TMDLWSCDxx**, Appendix D) lists dissolved oxygen and nutrient measurements in MINI-SONE sediment-water flux chambers.

SEDIMENT-WATER FLUX (Filename: **TMDLWSFLxx**, Appendix E) is a summary table providing oxygen and nutrient flux data.

WATER COLUMN RESPIRATION (Filename: **TMDLWSWKxx**, Appendix F) is a summary table providing surface water respiration rate data.

3.3.1 Data Tables QA/QC

Data recorded by instruments in the field were entered directly onto specially prepared data sheets. Data from samples analyzed by Nutrient Analytical Services Laboratory (NASL) were returned in written or electronic format. Data were keyed into the most recent version of Microsoft® Excel 2003. The standard EPC data file format was used. Hard copies of the files were manually checked for errors. Data files were corrected, a second printout was produced which was re-verified by a different staff member. The full data set was plotted and outlier values reevaluated. Values below detection limits are indicated in the data tables.

3.4. Analytical Methods QA/QC Control

The Nutrient Analytical Services Laboratory (NASL) at the Chesapeake Biological Laboratory provides nutrient analyses to University, State and Federal agencies. As part of the laboratory's QA/QC program, NASL participates in cross calibration exercises

with other institutions and agencies whenever possible. Refer to D'Elia *et al.* (1997) for specific details but some examples include:

- Particulate carbon and nitrogen cross calibration with Woods Hole Oceanographic Institution and Horn Point Environmental Laboratory.
- International Council for the Exploration of the Sea (ICES) inorganic nutrient round-robin communication. The fourth international inter-comparison report was published in 1991 (Kirkwood *et al.*, 1991).
- Comparisons of dissolved nutrient analyses conducted at Horn Point Environmental Laboratory, Bigelow Laboratory, the University of Delaware and the University of New Hampshire.
- Quarterly cross calibration exercises with Virginia Institute of Marine Science (VIMS) and Old Dominion University (ODU). The most recent inter-comparison (November 1995) confirmed all parameters routinely analyzed by these laboratories as part of the Chesapeake Bay Monitoring Program. Samples from various salinities and nutrient regimes were analyzed under this exercise.
- Environmental Protection Agency (EPA) unknown audits for various nutrients have been conducted.
- EPA audits of known nutrients were analyzed using samples in different salinity water while looking for possible matrix effects.

NASL has analyzed National Institute of Standards and Technology (NIST) and National Research Board of Canada reference materials, primarily estuarine sediment, as a check for their particulate and sediment carbon, nitrogen and phosphorus methods.

As part of the Chesapeake Bay Mainstem Monitoring Program, the laboratory routinely analyzes approximately ten percent of the total sample load for QA/QC checks. These samples include laboratory duplicates and spike analyses.

Specific EPC procedures included inorganic nitrogen (ammonium $[NH_4^+]$, nitrite $[NO_2^-]$, nitrite plus nitrate $[NO_2^- + NO_3^-]$) and dissolved inorganic phosphorus [DIP or PO_4^{3-}] for which a standard curve usually comprising five concentrations encompassing the expected range for that particular sample set, were analyzed at the beginning of each new run. A standard, which was treated as a sample, was analyzed at least every 20 samples. Baseline corrections were determined either manually or automatically, depending on the instrument providing the analysis. Data needed to calculate concentrations was recorded along with the sample concentration in laboratory notebooks, a carbon copy of which was provided to the EPC group. This procedure was also carried out for other parameters

performed by the laboratory in support of the EPC effort. Details of precision and limits of detection for the variables are given in D'Elia *et al.* (1997).

3.4.1. Sample Custody

Upon arrival at NASL, samples were counted, observed for potential problems (melting, broken containers, *etc.*) and placed in a freezer until analysis. Sample information and date of arrival were recorded on a log sheet.

3.4.2. Instrument Maintenance

Analytical instruments are maintained on a regular basis and records are kept of hours of operation, scheduled maintenance, pump tube changes, *etc.* A critical spare parts inventory is maintained for each instrument. Instrument down-time is minimized by troubleshooting instrument problems telephonically with manufacturers and service representatives. Spare parts can be received within 24 hours via next-day air service.

3.5. Calculations

The format of the calculations given below follows that used in the Excel files:

3.5.1. Oxygen Saturation

Percent oxygen saturation was calculated using the dissolved oxygen concentration, temperature and salinity data of the sample (Weiss, 1970).

$$DO\ SAT\ (\%) = (100*DO)/(1.428 * @ EXP (-173.4292 + (249.6339 * (100/(TEMP + 273))) + (143.3483 * @LN((TEMP + 273)/100)) - (21.8492 * ((TEMP + 273)/100)) + SALIN * (-0.033096 + (0.014259 * ((TEMP + 273)/100)) - 0.0017 * ((TEMP + 273)/100)^2)))$$

3.5.2. Eh

Corrected Eh represents Eh relative to the hydrogen electrode.

$$Eh\ CORR\ (mV) = Eh\ MEAS + 244$$

3.5.3. Flux Variables

3.5.3.1. Equations

Core Water Depth represents height of water above the sediment surface in the TMDL chamber.

$$Core\ H_2O\ Depth = (CORE\ VOL^a/CORE\ SURFACE\ AREA^b)/100^c$$

Where

- a is the measured volume of water in the sediment core (ml)
- b is the surface area measurement of the core cylinder (cm^2)
- c converts measurement units to m

General method for calculating net sediment-water fluxes:

$$\text{NET DO FLUX } (\text{gO}_2 \text{ m}^{-2} \text{ d}^{-1}) = [(\text{DO SLOPE}) * (\text{CORE H2O DEPTH}^a) x (1440^b)]$$

$$\text{NET NUTRIENT FLUX } (\mu\text{moles-N m}^{-2} \text{ h}^{-1}) = [(\text{VARIABLE SLOPE}^c) x (\text{Core H2O DEPTH}^d) x (60^e) x (1000^f)]$$

Where

- a converts measurements from volumetric to areal basis
- b converts time units from per minute to per day and from mg to g
- c variables are NH_4^+ , NO_2^- , $\text{NO}_2^- + \text{NO}_3^-$ and DIP
- d converts time units from minutes to hours
- e converts concentration to moles

Specific calculations:

a. Dissolved oxygen:

$$\text{DO FLUX } (\text{gO}_2 \text{ m}^{-2} \text{ d}^{-1}) = [(\text{DO SLOPE}) * 1440 * (\text{CORE H2O DEPTH})]$$

b. Ammonium:

$$\text{NH}_4^+ \text{ FLUX } (\mu\text{moles-N m}^{-2} \text{ h}^{-1}) = (\text{NH}_4^+ \text{ SLOPE} * 60 * \text{CORE H2O DEPTH}) * 1000$$

c. Nitrite:

$$\text{NO}_2^- \text{ FLUX } (\mu\text{moles-N m}^{-2} \text{ h}^{-1}) = (\text{NO}_2^- \text{ SLOPE} * 60 * \text{CORE H2O DEPTH}) * 1000$$

d. Nitrite plus nitrate

$$\text{NO}_2^- + \text{NO}_3^- \text{ FLUX } (\mu\text{moles-N m}^{-2} \text{ h}^{-1}) = (\text{NO}_2^- + \text{NO}_3^- \text{ SLOPE} * 60 * \text{CORE H2O DEPTH}) * 1000$$

e. Dissolved Inorganic Phosphorus

$$\text{DIP FLUX } [\mu\text{moles-P m}^{-2} \text{ h}^{-1}] = (\text{DIP SLOPE} * 60 * \text{CORE H2O DEPTH}) * 1000$$

3.5.3.2. Criteria for accepting, rejecting and modifying variable slopes used in calculating net sediment water fluxes

Nutrient concentrations were plotted against time of sampling and the slope of this curve is used to calculate net sediment-water exchanges. The following steps assume that all data have been previously verified following normal protocols.

1. If the slope of the nutrient concentrations vs. time plot was statistically significant, the slope was used in calculating fluxes without modification.
2. Occasionally, there are plots which indicated a clear increasing or decreasing trend in concentrations over time but had **one** data point which diverged strongly (either higher or lower concentration) from the trend. We consider these divergent data to represent contaminated samples (either by addition of the compound or addition of water having a much lower concentration of the compound) and they are not used. The slope was recalculated using lower degrees of freedom and a higher "r" value as a criteria for significance. If the slope is statistically significant, it was used in calculating fluxes.
3. If the concentration vs. time plots were erratic (*i.e.* no statistically significant increasing or decreasing trend in concentration over time) and if the difference in concentration among variables was **greater than** twice the detection limit for that variable, the data for that variable were considered to be non-interpretable. The slope was not calculated and the entry for that variable in the data file was recorded as "NI".
4. If the concentration vs. time plots were erratic (*i.e.* no statistically significant increasing or decreasing trend in concentration over time) and if the difference in concentration among variables was **less than** twice the detection limit for that variable, then the slope was taken to be zero and the net sediment-water flux was reported as zero. Occasionally, statistically significant slopes have been found for some variables (mostly nitrite and dissolved inorganic phosphorus) where concentration differences over the incubation period do not exceed twice the reported detection limit. These slopes were used to calculate net sediment-water exchanges.

Table 3-1. Analysis Problem Codes*This table is added here for reference.*

ANALYSIS PROBLEM CODE	DESCRIPTION
A	Laboratory accident
B	Interference
C	Mechanical/materials failure
D	Insufficient sample
N	Sample Lost
P	Lost results
R	Sample contaminated
S	Sample container broken during analysis
V	Sample results rejected due to QA/QC criteria
W	Duplicate results for all parameters
X	Sample not preserved properly
AA	Sample thawed when received
BB	Torn filter paper
EE	Foil pouch very wet when received from field, therefore poor replication between pads, mean reported
FF	Poor replication between pads; mean reported
HD	Particulate and chlorophyll-a samples only taken at -1.0 cm of the Eh profile
HH	Sample not taken
JJ	Amount filtered not recorded (Calculation could not be done)
LL	Mislabeled
NI	Data for this variable are considered to be non-interpretable
NN	Particulates found in filtered sample
NR	No replicate analyzed for epiphyte strip chlorophyll-a concentration
PP	Assumed sample volume (pouch volume differs from data sheet volume; pouch volume used)
QQ	Although value exceeds a theoretically equivalent or greater value (e.g., PO4F>TDP), the excess is within precision of analytical techniques and therefore not statistically significant.
SD	All sampling at station discontinued for one or more sampling periods
SS	Sample contaminated in field
TF	Dissolved oxygen probe failure
TL	Instrument failure in research laboratory
TS	Dissolved oxygen probe not stabilized
TT	Instrument failure on board research vessel
UU	Analysis discontinued
WW	Station was not sampled due to bad weather conditions, research vessel mechanical failure, or failure of state highway bridges to open or close
XX	Sampling for this variable was not included in the monitoring program at this time or was not monitored during a specific cruise
YB	No blank measured for MINI-SONE fluxes
YY	Data not recorded
